

FolderMCP PDF extraction fixture page one introduces the document. This paragraph mentions quasar telemetry as a unique probe phrase and then continues with enough additional prose to comfortably exceed the digital-native two-hundred-character-per-page extraction quality gate.

A second paragraph on page one adds more prose so the recursive splitter has real material to anchor page and paragraph numbers against, and so the page stays well above the minimum character threshold for indexing.

Page two begins after the form feed boundary and opens a new section. It discusses photosynthesis pipelines as another unique probe phrase, continuing with sufficient prose to keep this page above the digital native extraction quality threshold of two hundred characters per page.

A trailing paragraph on page two ensures multiple paragraphs exist so the paragraph counter in the chunk header advances beyond one as well.
